INTRODUCTION TO PAAS AND SALESFORCE

• What is PaaS ?

PaaS is a cloud computing model that provides a ready to use platform for developers to build, test, deploy and manage application without worrying about underlying hardware, servers, storage or networking.

• Benefits of PaaS:

- * Faster Development
- * Cost - Effective
- * Scalability
- * Reduce Maintenance
- * Eg:- Salesforce, AWS

Trailhead :-

Official online learning platform by Salesforce technologies, through interactive modules, hands-on exercises, and real projects helps users to learn, Salesforce skills.

- (1) Use lightning app builder :- drag and drop interface with features like creating pages, adding components such as buttons, forms etc.
- (2) Create lightning components :- developers build reusable UI elements called lightning components such as buttons, forms etc.
- (3) Connect to Salesforce data :- setting up trailblazer playground.

* Trailblazer playground is a personal Salesforce developer env. provided through Salesforce trail head where users can practice test and build application safely.

* Signed up for Salesforce and launched the trailblazer playground.

* creating a trailblazer app :- building basic app in sales force.

* creating custom objects :- Eg. student object with fields like email, name, course.

* Adding fields and datatypes :- Eg. data type for name & text and email & email.

(4) Automating process in trailblazer app:-

Proves automation in salesforce & the use of built-in tools to automatically execute business processes based on specific triggers, conditions or events.

Eg:- when a new student record is created send welcome email automatically. The cause time and manual efforts reduces human error and improves workflow efficiency

Flow builder :- used to create complex workflows using a visual interface.

Automates record updates approval.

Eg:- creating a flow for automatically sending welcome email when next student record is created.

Process builder :-

A rather tool to automatically perform action when certain condition are met. Now flow builder is encouraged compared to process builder.

Deploying and testing the trailblazer app.

Developed test the app to verify the automation rules, flows, and component behave as expected
